

Introduction to version control with Git

Day 2: Branching, Merging and collaboration workflows

Selina Baldauf

September 28, 2025

Before we start

Let's check if we are all set with the [teams](#).

Recap

Basic Git workflow:

1. **Initialize** a Git repository
2. **Work** on the project
3. **Stage** and **commit** changes to the local repository
4. **Push** to the remote repository

Recap

Basic Git workflow:

1. **Initialize** a Git repository
2. **Work** on the project
3. **Stage** and **commit** changes to the local repository
4. **Push** to the remote repository

Recap

Git is a **distributed version control system**

- Idea: many *local* repositories synced via one *remote* repo
- Collaborate with
 - **yourself** on different machines
 - your **colleagues** and friends
 - **strangers** on open source projects

Get a repo from a remote

In Git language, this is called **cloning**

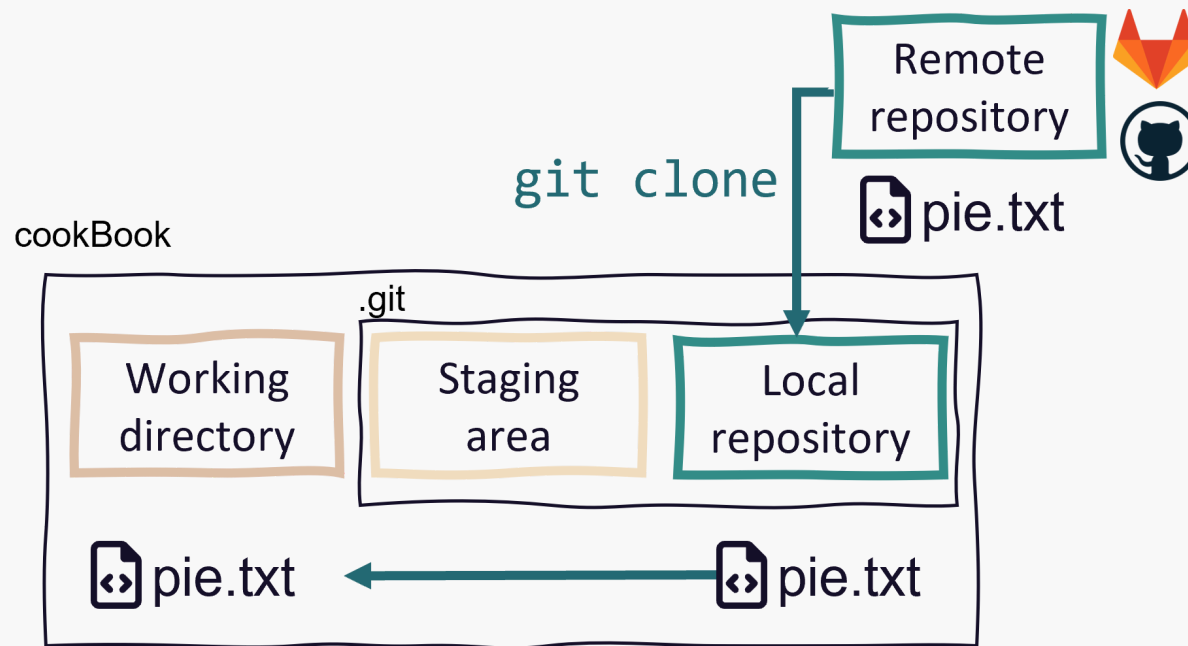

- Get a **full copy** of the remote repo

Get a repo from a remote

In Git language, this is called **cloning**

- Get a **full copy** of the remote repo

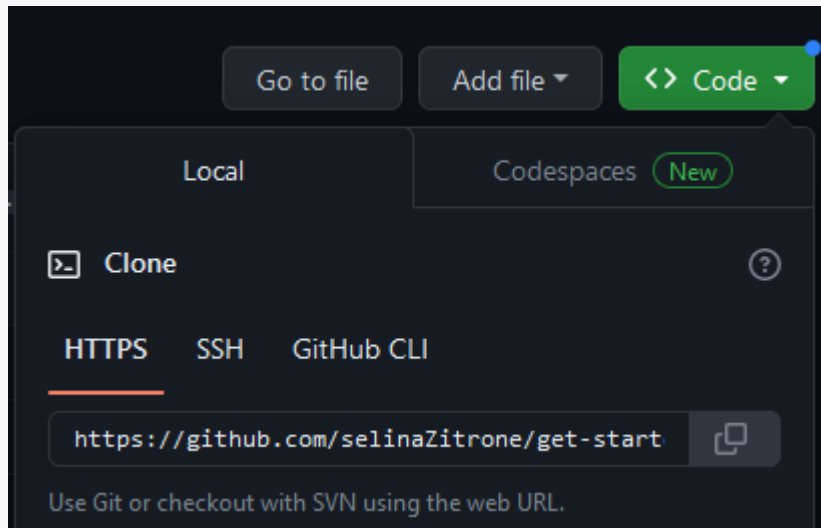

Get a repo from a remote

You can clone

- all of your own repositories (public and private)
- all repositories you are a collaborator on (public and private)
- all public repositories of other people

All you need is the URL of the remote repository

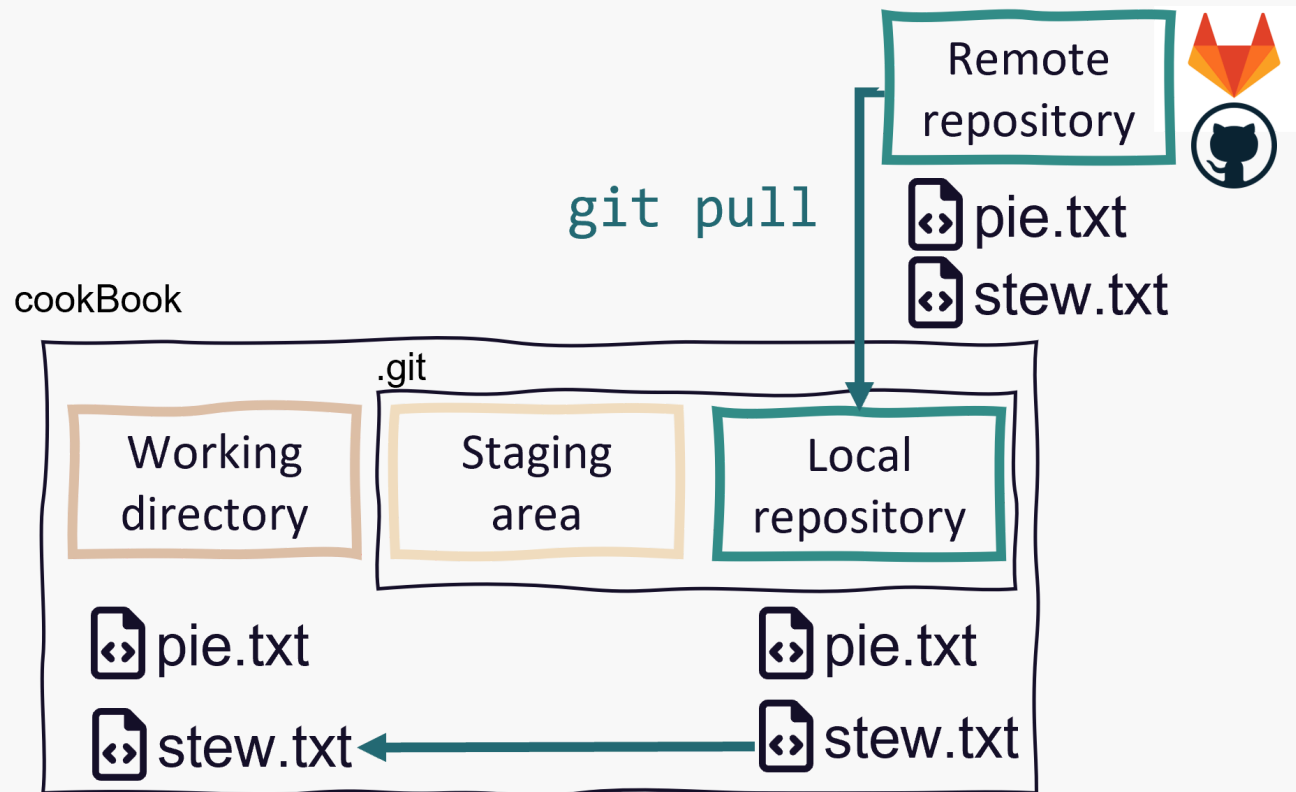

Now you (5 min)

Clone your team mate's cook Book repo
Details in [Task 2 "Clone"](#)

Get changes from the remote

- Local changes, publish to remote: `git push`
- Remote changes, pull to local: `git pull`

A simple collaboration workflow

- One remote repo on GitHub, multiple local repos (Bob and me)
- Idea: Everyone works on the same branch
 - Pull before you start working
 - Push after you finished working

A simple collaboration workflow

This works well if

- Repo is not updated often
- You don't work on the same files simultaneously
- No need to discuss changes before they are integrated
- You collaborate with yourself

Let's give it a try

- Make sure you are in the repository of your team mate
- Open a recipe in the cook book of your team mate
 - Repository -> Show in Explorer
- Change something in there
- Commit the change and push it

Get the changes of your team mate from the remote.

- Switch to your own cook book repository
- Pull the changes (Same button as the push button)
- Have a look at the commit history to see what changed

A simple collaboration workflow

This workflow starts to be problematic when

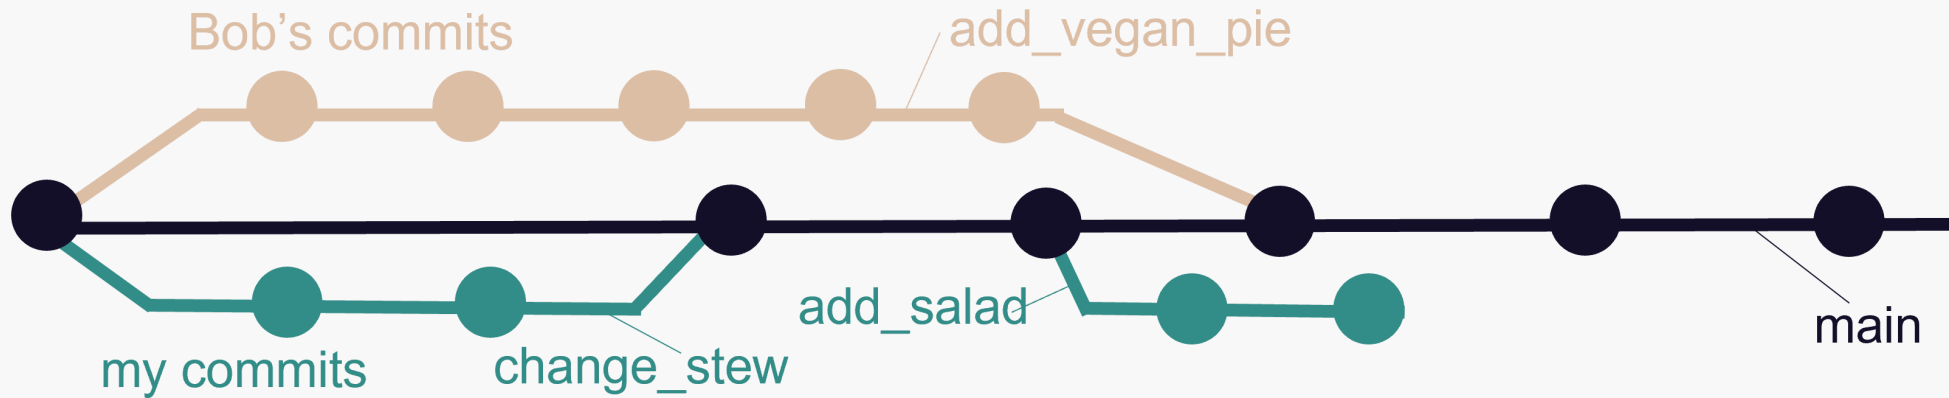

- People push often/forget to pull regularly
 - Potential conflicts on main
- You just want to experiment
 - Everything goes directly to main

A branching-merging workflow

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on their **separate branch**
 - **Merge** branch with the main when work is done
- **Pull before** and **push after** working

A branching-merging workflow

Advantages of this approach

- Guarantee that main always works
- Potential conflicts don't have to be solved on main
- You can experiment without messing up the main

Working on a separate branch

The steps to create and work on a separate branch are easy:

- Create a local branch and switch to it
- Work on the branch like you are used to
 - Make changes, **stage** and **commit**

Merging changes from a branch

To bring changes to the main branch you need to **merge** them.

Git merge brings the commits from the branch to main

Merging changes from a branch

To bring changes to the main branch you need to **merge** them.

If there was a commit in main, a *merge commit* is introduced.

Merging changes from a branch

To bring changes to the main branch you need to **merge** them.

If there was a commit in main, a *merge commit* is introduced.

Now you (10 min)

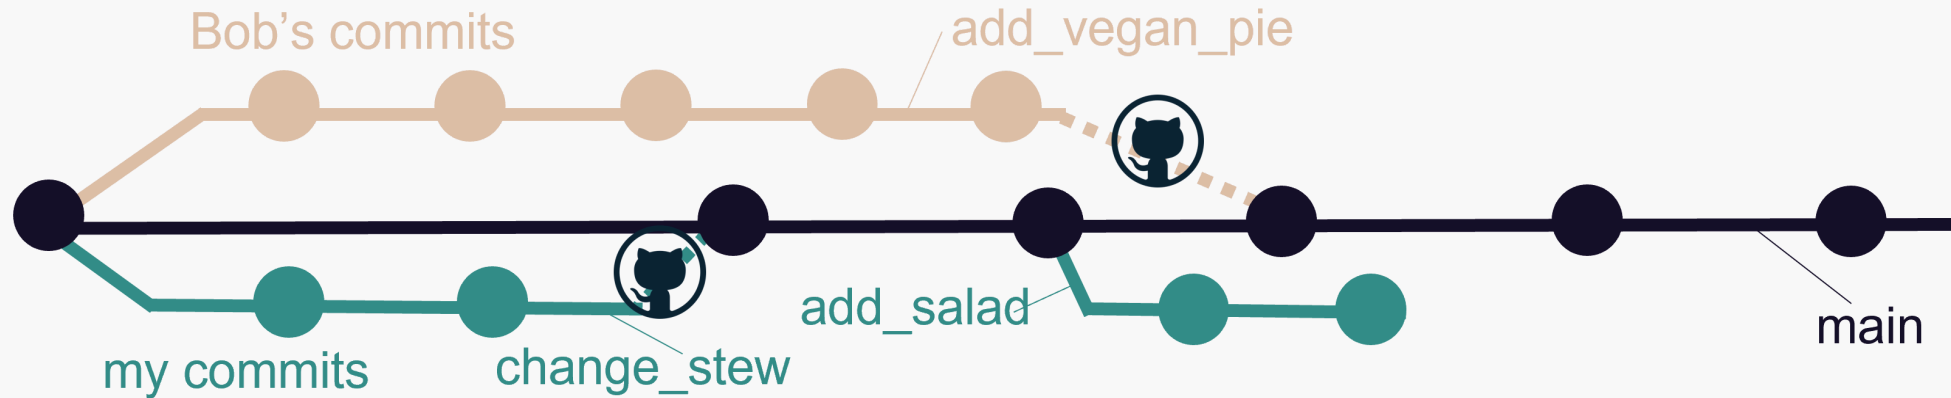

Create a branch and merge it in your team mate's cook book
Complete task 2 "Branch and merge"

A branching-merging workflow with GitHub

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on their separate branch
 - ~~Merge branch with the main when work is done~~

A branching-merging workflow with GitHub

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on their separate branch
 - ~~Merge branch with the main when work is done~~
 - Create a pull request on GitHub to ask for a merge
- Pull before and push after working

A branching-merging workflow with GitHub

A pull request is basically asking your collaborators:

What do you think of my changes? Can we integrate them in main or do we still need to change something?

GitHub has nice features for pull requests, e.g.:

- **Provide context and explanations** for your changes
- Collaborators can easily **compare versions**
- Collaborators can **discuss and comment** on your changes

A pull request is merged on GitHub when **everyone agreed on the code**.

Now you (10 min)

Create a pull request on your team mate's repo
Complete task 3 "Pull requests"

Some good practice tips

Git

- Commit often (small changes that can be described in one commit message)
- Write good commit messages (it becomes a habit)
- Push (at least) daily (backup!)
- Use `.gitignore`
- Don't commit secrets ;)

Publishing

Some essentials that will improve your published repository:

- Add a good README.md file
 - Tell people what your project is about and how to use it
 - Check out the [GitHub documentation](#) for formatting options
- Add a LICENSE file
 - Tell others how to use your code
- Add a DOI to your repository (e.g. via [Zenodo](#))

If you are interested, browse some nice GitHub repositories for inspiration (e.g. [Computational notebooks guide](#))

What now?

- Git can seem complicated at first, but you will get used to it
- Make it a habit to use Git, start with your own projects
- Improve your workflow step by step
- Practice makes perfect

Check out the [resources page](#) and the different How-tos for more info and practice.

Thanks for your attention
