

Introduction to version control with Git

Day 2: Branching, Merging and collaboration workflows

Selina Baldauf

November 17, 2024

Before we start

Let's check if we are all set with the [teams](#).

Recap

Basic Git workflow:

1. **Initialize** a Git repository
2. **Work** on the project
3. **Stage** and **commit** changes to the local repository
4. **Push** to the remote repository

Recap

Basic Git workflow:

1. **Initialize** a Git repository
2. **Work** on the project
3. **Stage** and **commit** changes to the local repository
4. **Push** to the remote repository

Recap

Git is a **distributed version control system**

- Idea: many *local* repositories synced via one *remote* repo
- Collaborate with
 - **yourself** on different machines
 - your **colleagues** and friends
 - **strangers** on open source projects

Get a repo from a remote

In Git language, this is called **cloning**

- Get a **full copy** of the remote repo

Get a repo from a remote

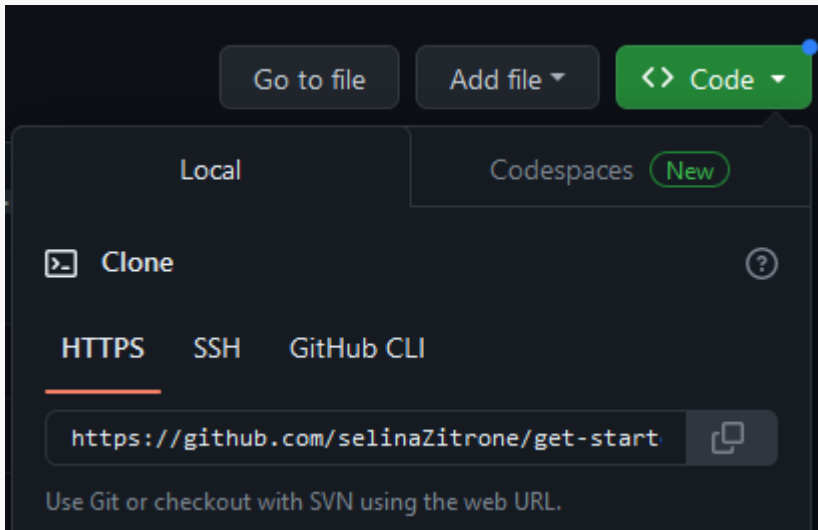

In Git language, this is called **cloning**

- Get a **full copy** of the remote repo

Get a repo from a remote

To clone a repo, you need to know the repo's URL

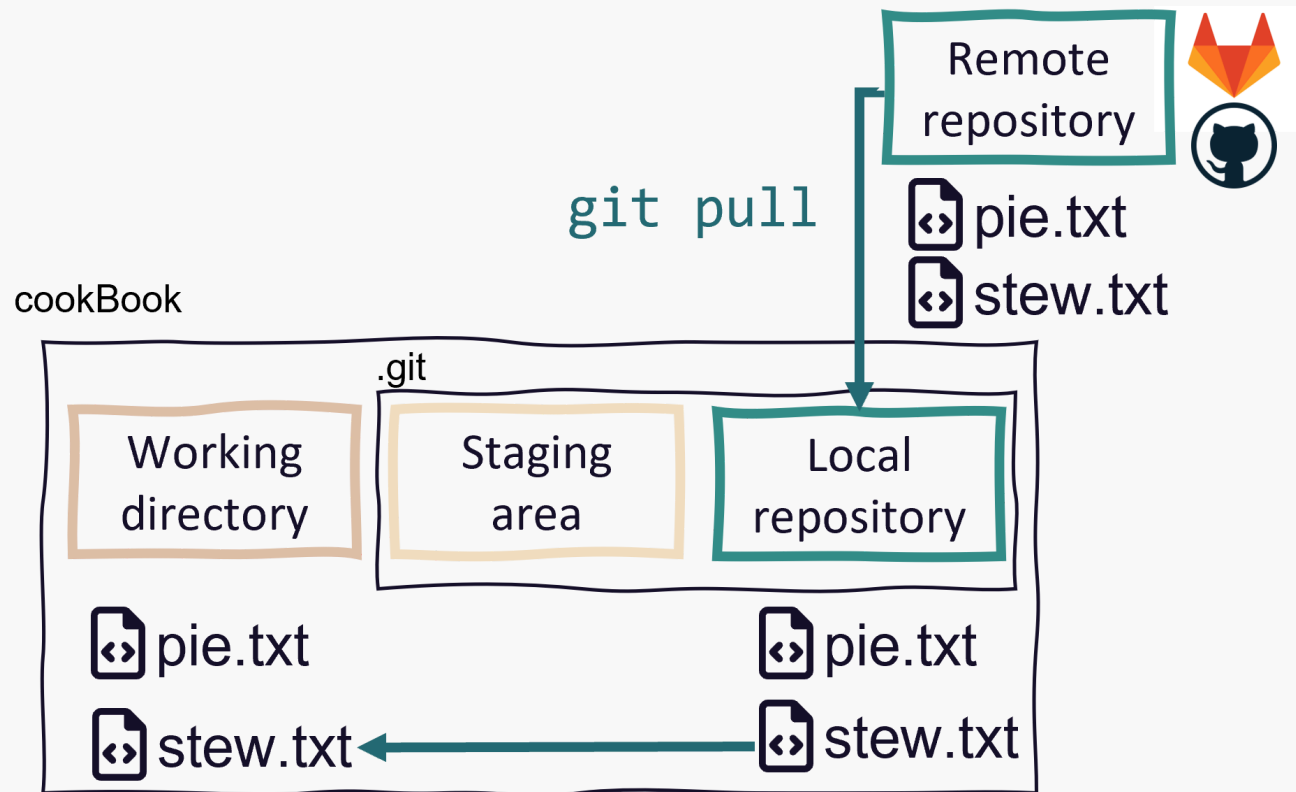

- You can clone all public repositories
 - You can only push if you are authorized
- You can clone private repositories if you are a owner/collaborator

Now you (5 min)

Clone your team mate's cook Book repo (**File -> Clone repository**)
It should be in the list of your repositories if you accepted the invitation.

Get changes from the remote

- Local changes, publish to remote: `git push`
- Remote changes, pull to local: `git pull`

A simple collaboration workflow

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on the same branch
 - Pull before you start working
 - Push after you finished working

A simple collaboration workflow

This works well if

- Repo is not updated often
- You don't work on the same files simultaneously
- No need to discuss changes before they are integrated
- You collaborate with yourself

A simple collaboration workflow

This workflow starts to be problematic when

- People push often/forget to pull regularly
 - Potential conflicts on main
- You just want to experiment
 - Everything goes directly to main

Let's give it a try

- Make sure you are in the repository of your team mate
- Open a recipe in the cook book of your team mate
 - Repository -> Show in Explorer
- Change something in there
- Commit the change and push it

Get the changes of your team mate from the remote.

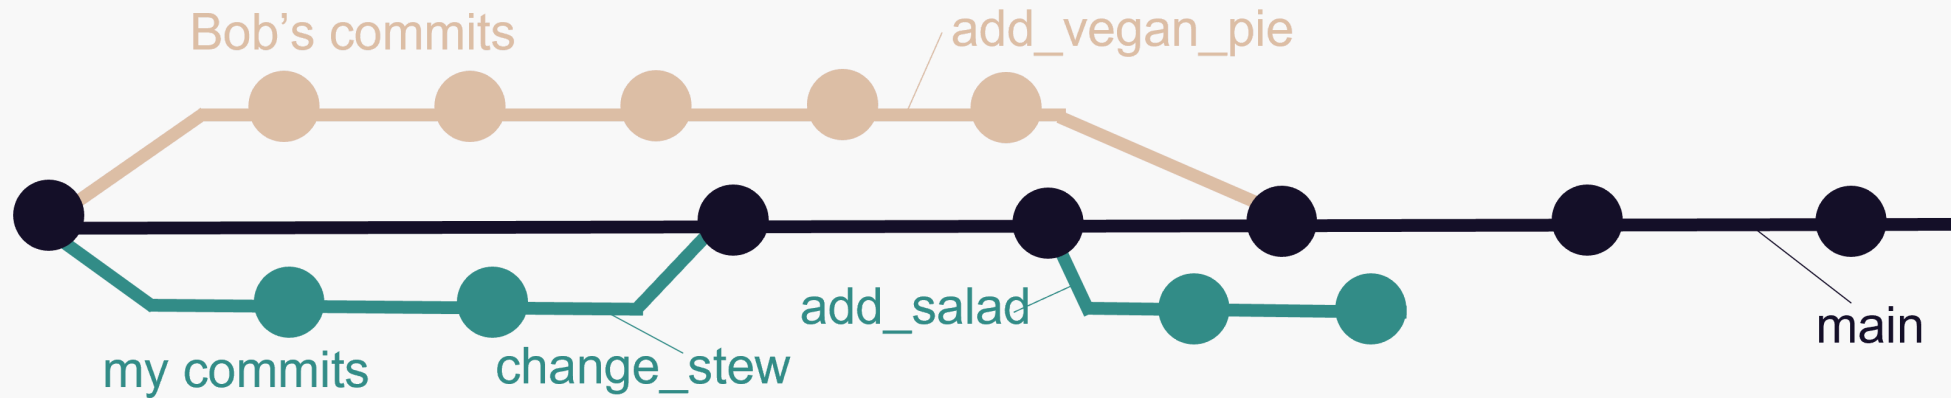

- Switch to your own cook book repository
- Pull the changes (Same button as the push button)
- Have a look at the commit history to see what changed

A branching-merging workflow

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on their **separate branch**
 - **Merge** branch with the main when work is done
- **Pull before** and **push after** working

A branching-merging workflow

Advantages of this approach

- Guarantee that `main` always works
- Potential conflicts don't have to be solved on `main`
- You can experiment without messing up the `main`

Working on a separate branch

The steps to create and work on a separate branch are easy:

- Create a local branch and switch to it
- Work on the branch like you are used to
 - Make changes, **stage** and **commit**

Merging changes from a branch

To bring changes to the main branch you need to **merge** them.

Git merge brings the commits from the branch to main

Now you (10 min)

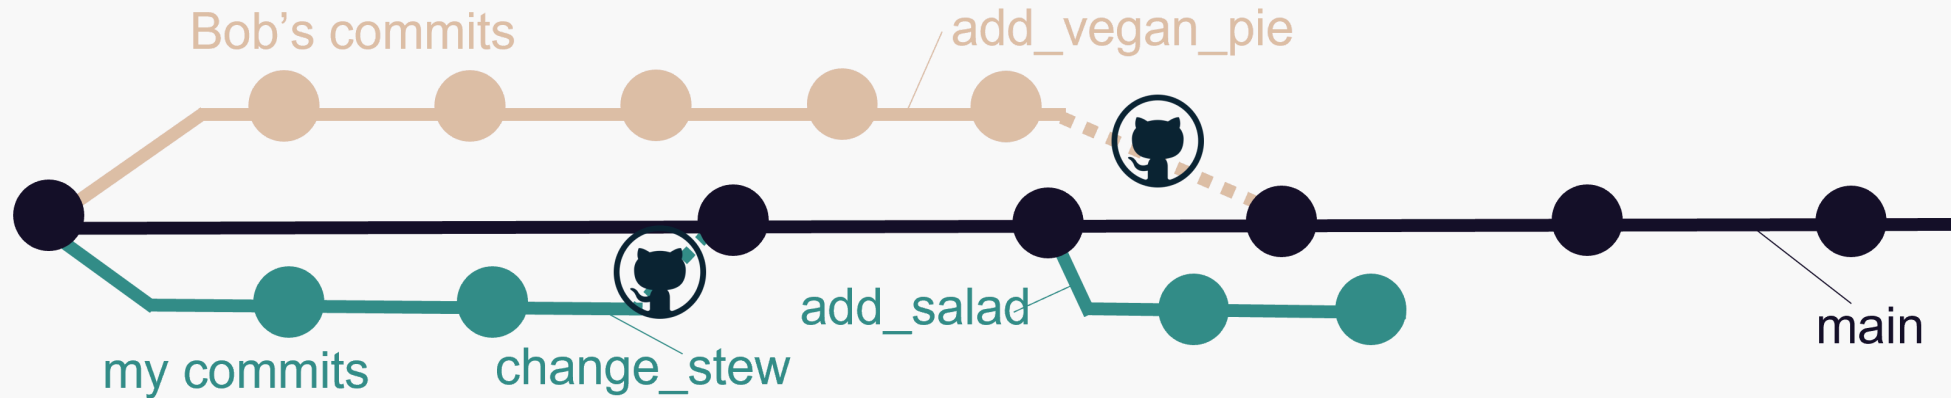

Create a branch and merge it in your team mate's cook book
Complete task 2 "Branch and merge"

A branching-merging workflow with GitHub

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on their separate branch
 - ~~Merge branch with the main when work is done~~

A branching-merging workflow with GitHub

- One remote repo on GitHub, multiple local repos
- Idea: Everyone works on their separate branch
 - ~~Merge branch with the main when work is done~~
 - Create a pull request on GitHub to ask for a merge
- Pull before and push after working

A branching-merging workflow with GitHub

A pull request is basically asking your collaborators:

What do you think of my changes? Can we integrate them in main or do we still need to change something?

GitHub has nice features for pull requests, e.g.:

- **Provide context and explanations** for your changes
- Collaborators can easily **compare versions**
- Collaborators can **discuss and comment** on your changes

A pull request is merged on GitHub when **everyone agreed on the code**.

Now you (10 min)

Create a pull request on your team mate'S repo
Complete task 3 "Pull requests"

Thanks for your attention

Questions?

Next week

- Monday 2.30 - 3.30 on Webex (link via email)
- Until then: work with Git on your own (~ 1 - 2 h)
 - Pick something you find most interesting/useful to you
- Collect questions/problems/discoveries
- More Git topics

Some ideas

- **Start working** with Git on one of **your research projects**
- **Publish** one of your projects on GitHub including a nice README
- **Practice collaboration** by contributing to your team mate's cook using pull requests
 - Your team mate can answer your pull requests and request some changes :)

Some ideas

- Check out the **How-To guides** if you want to
 - [Recap GH Desktop](#)
 - learn about Git in the [terminal](#)
 - learn about [Git + R](#)
- If you find a mistake on my websites
 - **Edit the page** on GitHub (and make a Pull request) or **report an issue**
- Checkout the additional [resources](#)

Appendix

Merging changes from a branch

To bring changes to the main branch you need to **merge** them.

If there was a commit on a common file in main, a *merge commit* is introduced.

Merging changes from a branch

To bring changes to the main branch you need to **merge** them.

- Mostly merging happens without problems, but...
- ... if the same line was edited on separate branches...
- ... there will be a merge conflict 🤖

Merge conflicts need to be solved manually. You need to chose which of the conflicting versions you want to keep.
