

Introduction to version control with Git

Day 1: Concepts and a basic workflow

Selina Baldauf

September 25, 2023

Who am I?

Scientific programmer @ theoretical ecology group

What do you want to learn here?

... use Git and Github effectively

... make my code publicly available on GitHub

... work with others on projects

... contribute to an open source project

... roll back things (safely)

... write good commit messages?

...

Aims of the workshop

Git is a huge topic and Git is very powerful.

Learn simple Git workflows in **theory and practice** that you can immediately apply to your research projects.

Topics

Today 2.30 - 4 pm

- Introduction to Git concepts
- Simple Git workflow for your own projects

Tomorrow 2.30 - 4 pm

- Collaborate using Git and Github

Next Monday 2.30 - 3.30 pm

- Until then: work with Git on your own projects
- Q&A
- Advanced topics

Organization

- Material is all online
- Certificate of attendance from the graduate center
- Feedback is very welcome
- Just interrupt me for questions/comments

Before we start

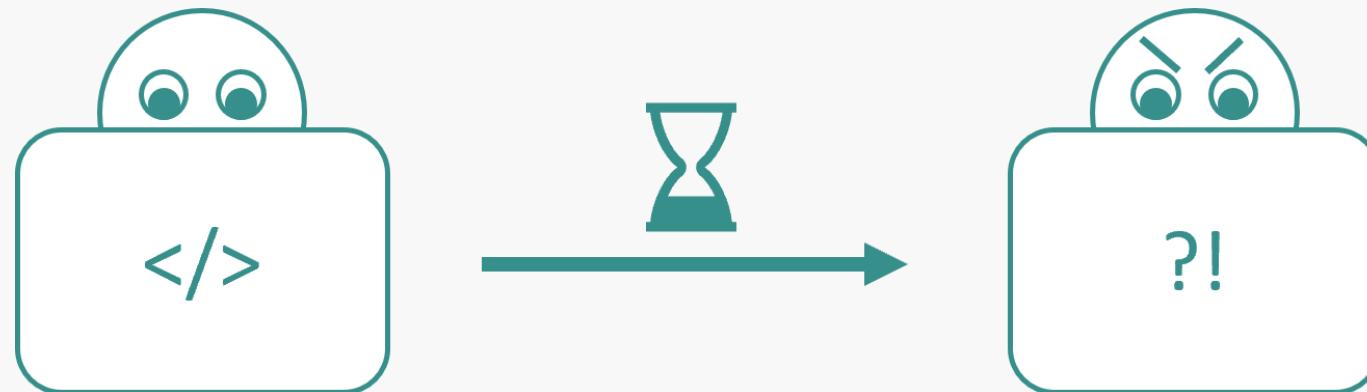

Did anyone have problems with the workshop preparation?

- Install Git
- Install Github Desktop
- Get a Github account and connect it with Github Desktop

Let's get started

Why version control?

Two examples in which proper version control can be a time/stress saver

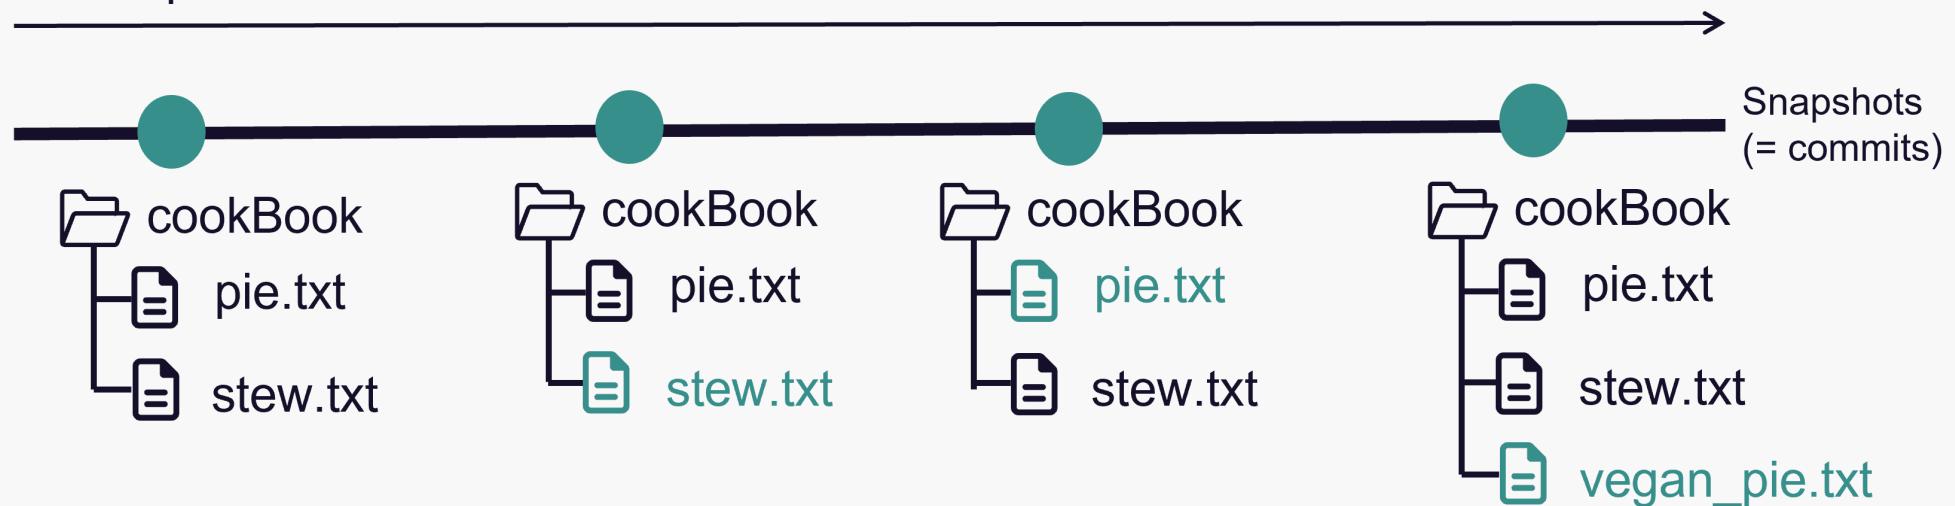

Version control with Git

- Complete and **long-term** history of every file in your project
- Open source and **free** to use version control software
- Quasi **standard** for software development
- A whole universe of **other software and services** around it

Version control with Git

- For projects with mainly text files (e.g. code, markdown files, ...)
- Basic idea: Take snapshots (**commits**) of your project over time

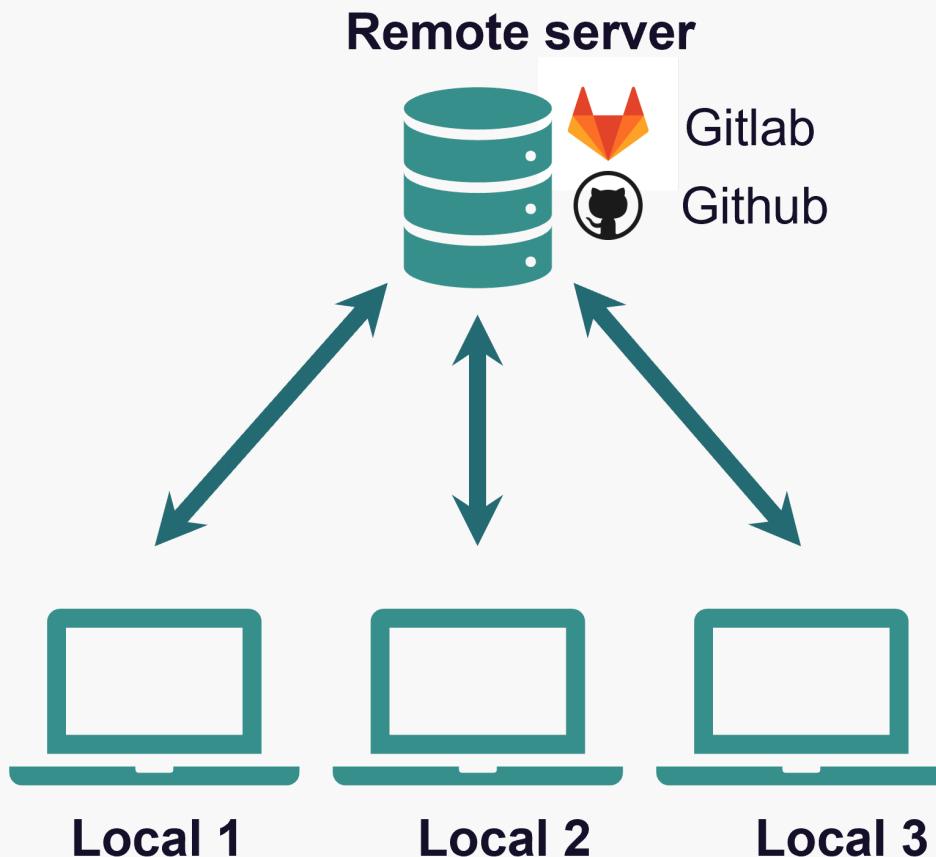

Development over time

- A project version controlled with Git is a **Git repository (repo)**

Version control with Git

Git is a **distributed version control system**

- Idea: many *local* repositories synced via one *remote* repo
- Everyone has a complete copy of the repo

How to use Git

After you [installed](#) it there are different ways to interact with the software.

How to use Git - Terminal

Using Git from the terminal

```
selina_user@DESKTOP-G0RM7MS MINGW64 ~/Files_Selina
$ cd Repos/02_workshops/first_git_project/

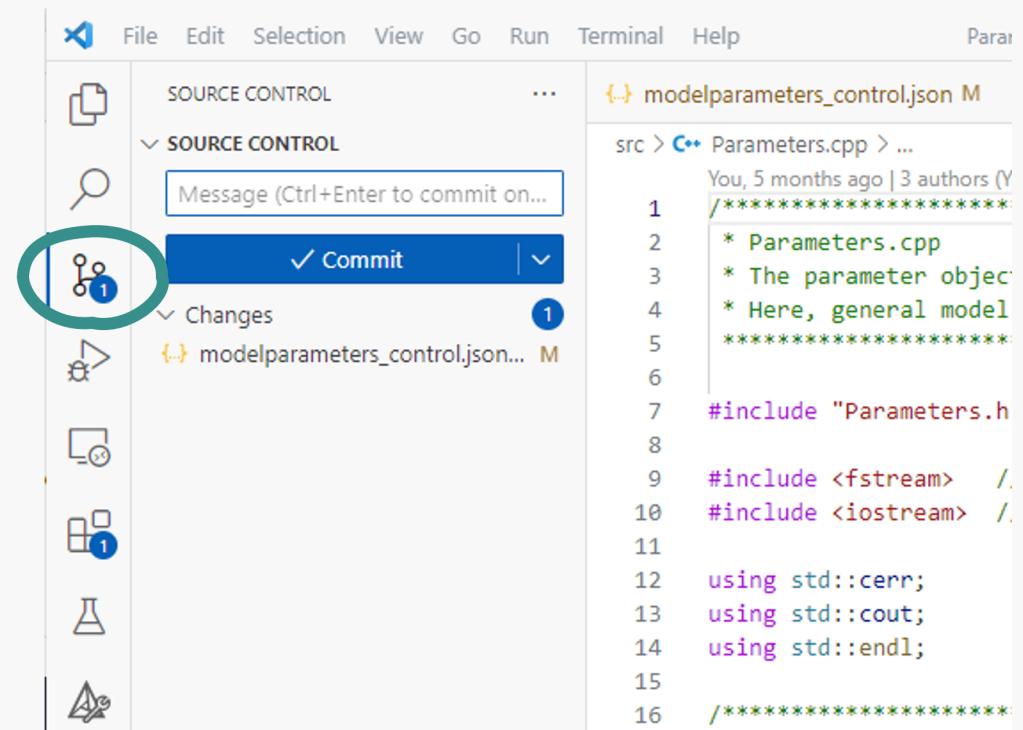

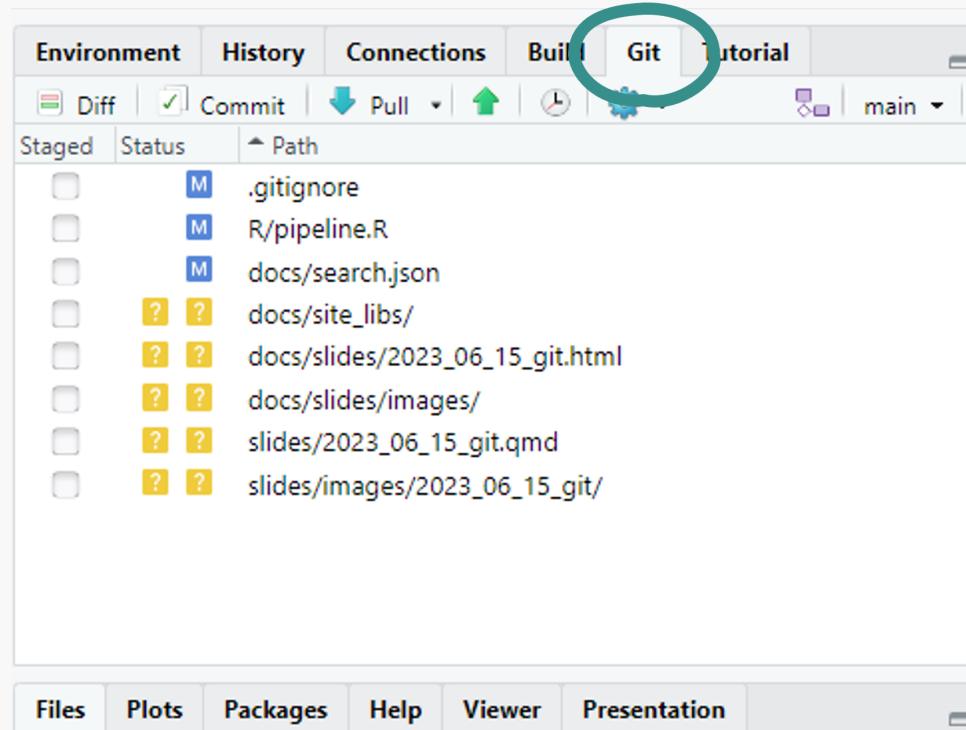

selina_user@DESKTOP-G0RM7MS MINGW64 ~/Files_Selina/Repos/02_workshops/first_git_
project
$ git init
Initialized empty Git repository in C:/Users/selina_user/Files_Selina/Repos/02_w
orkshops/first_git_project/.git/
selina_user@DESKTOP-G0RM7MS MINGW64 ~/Files_Selina/Repos/02_workshops/first_git_
project (master)
$ ..
```

- + Most control
- + A lot of help/answers online

- You need to use terminal 

How to use Git - Integrated GUIs

A Git GUI is integrated in most (all?) IDEs, e.g. R Studio, VS Code

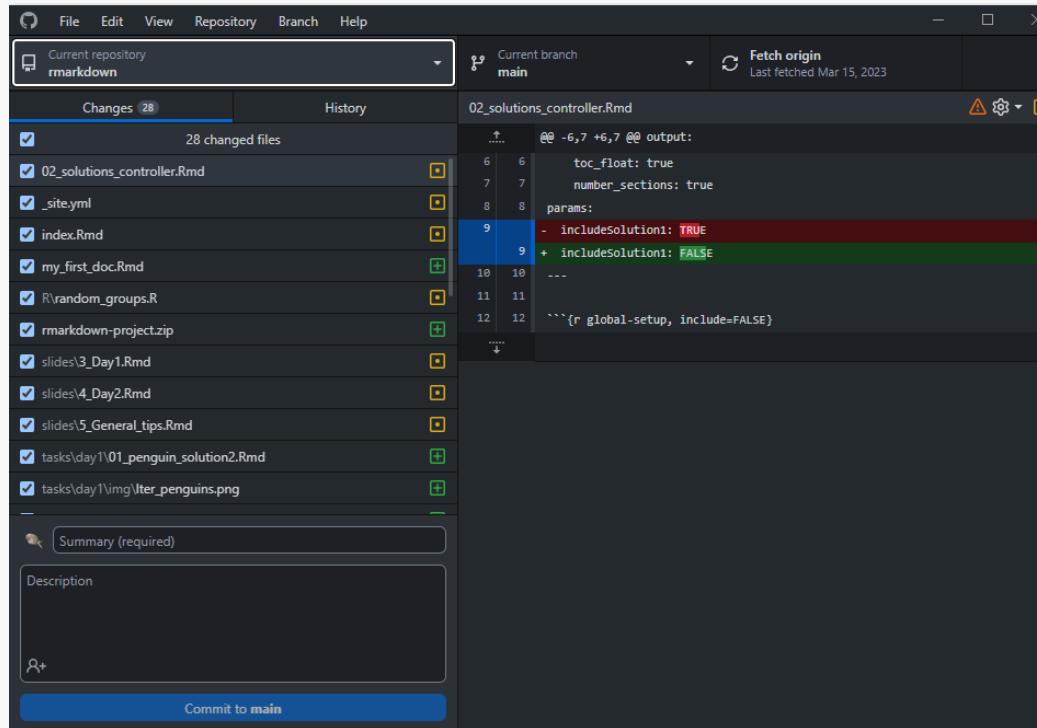

- + Easy and intuitive
- + Stay inside IDE

- Different for every program

How to use Git - Standalone GUIs

Standalone Git GUI software, e.g. Github Desktop, Source Tree, ...

- + Easy and intuitive
- + Use for all projects

= Switch programs to use Git

How to use Git

Which one to choose?

- Depends on experience and taste
- You can mix methods because they are all interfaces to the same Git
- We will use Github Desktop
 - Beginner-friendly, intuitive and convenient
 - Nice integration with Github

Have a look at the [website](#) where you find **How-To guides for the other methods** as well.

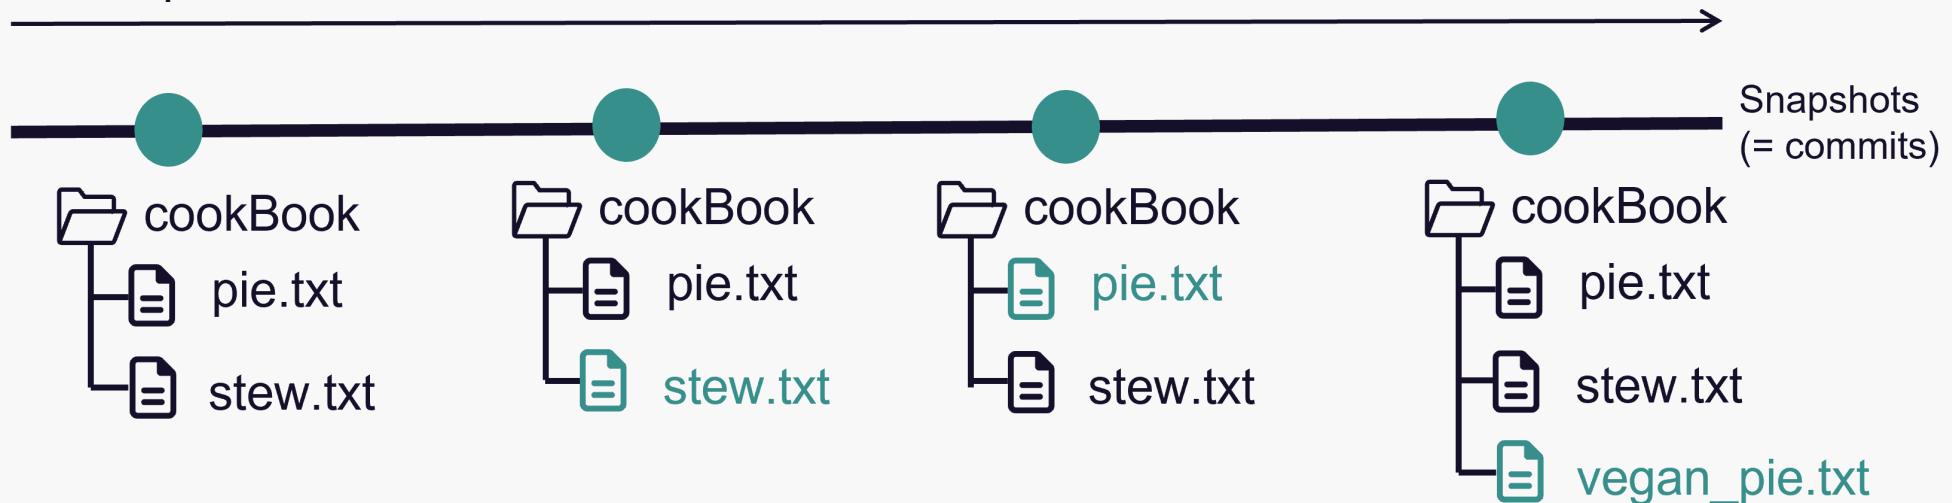

The basic Git workflow

git init, git add, git commit, git push

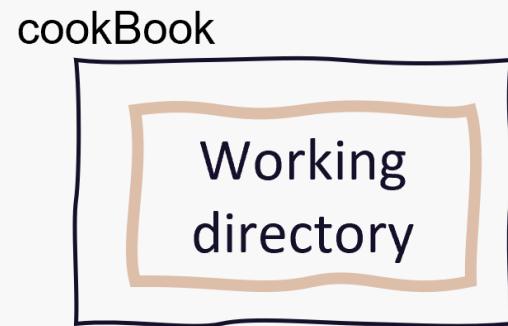

Example

A cook book project to collect all my favorite recipes.

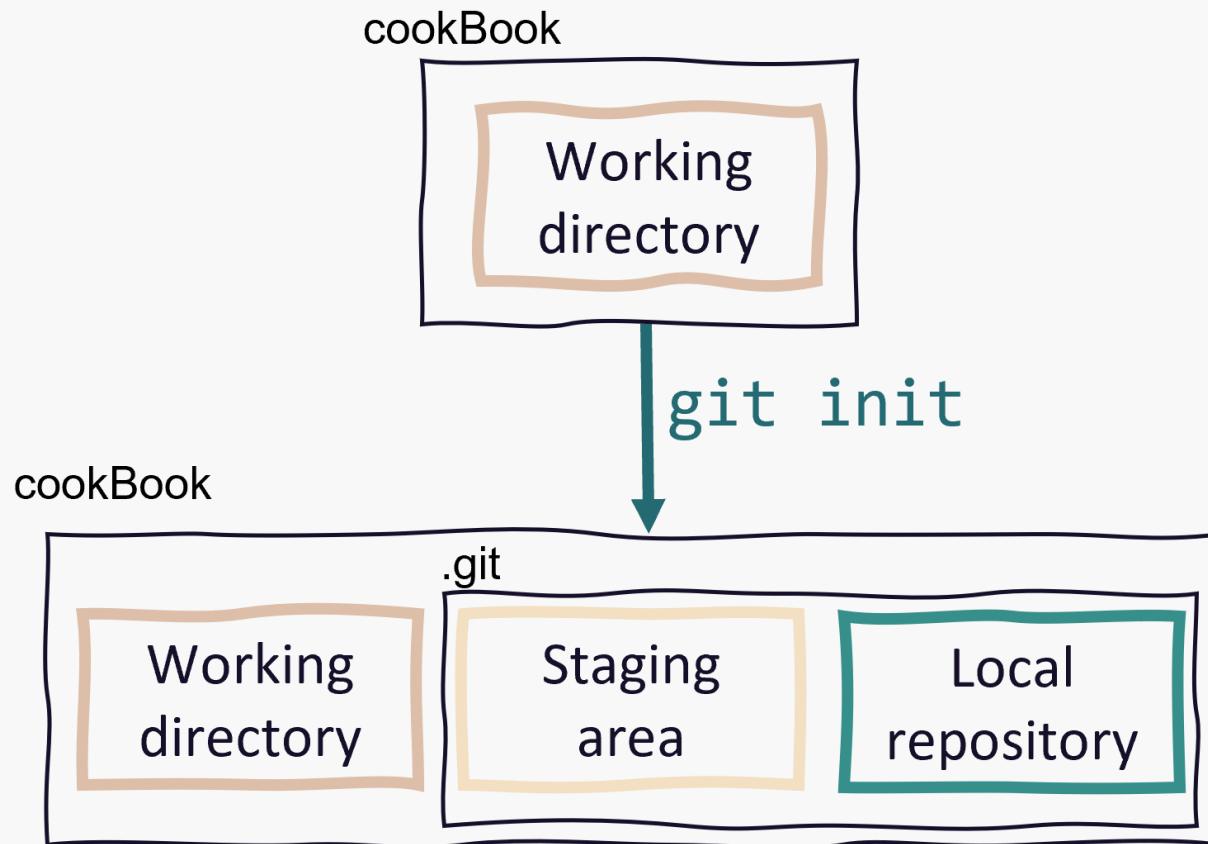

Development over time

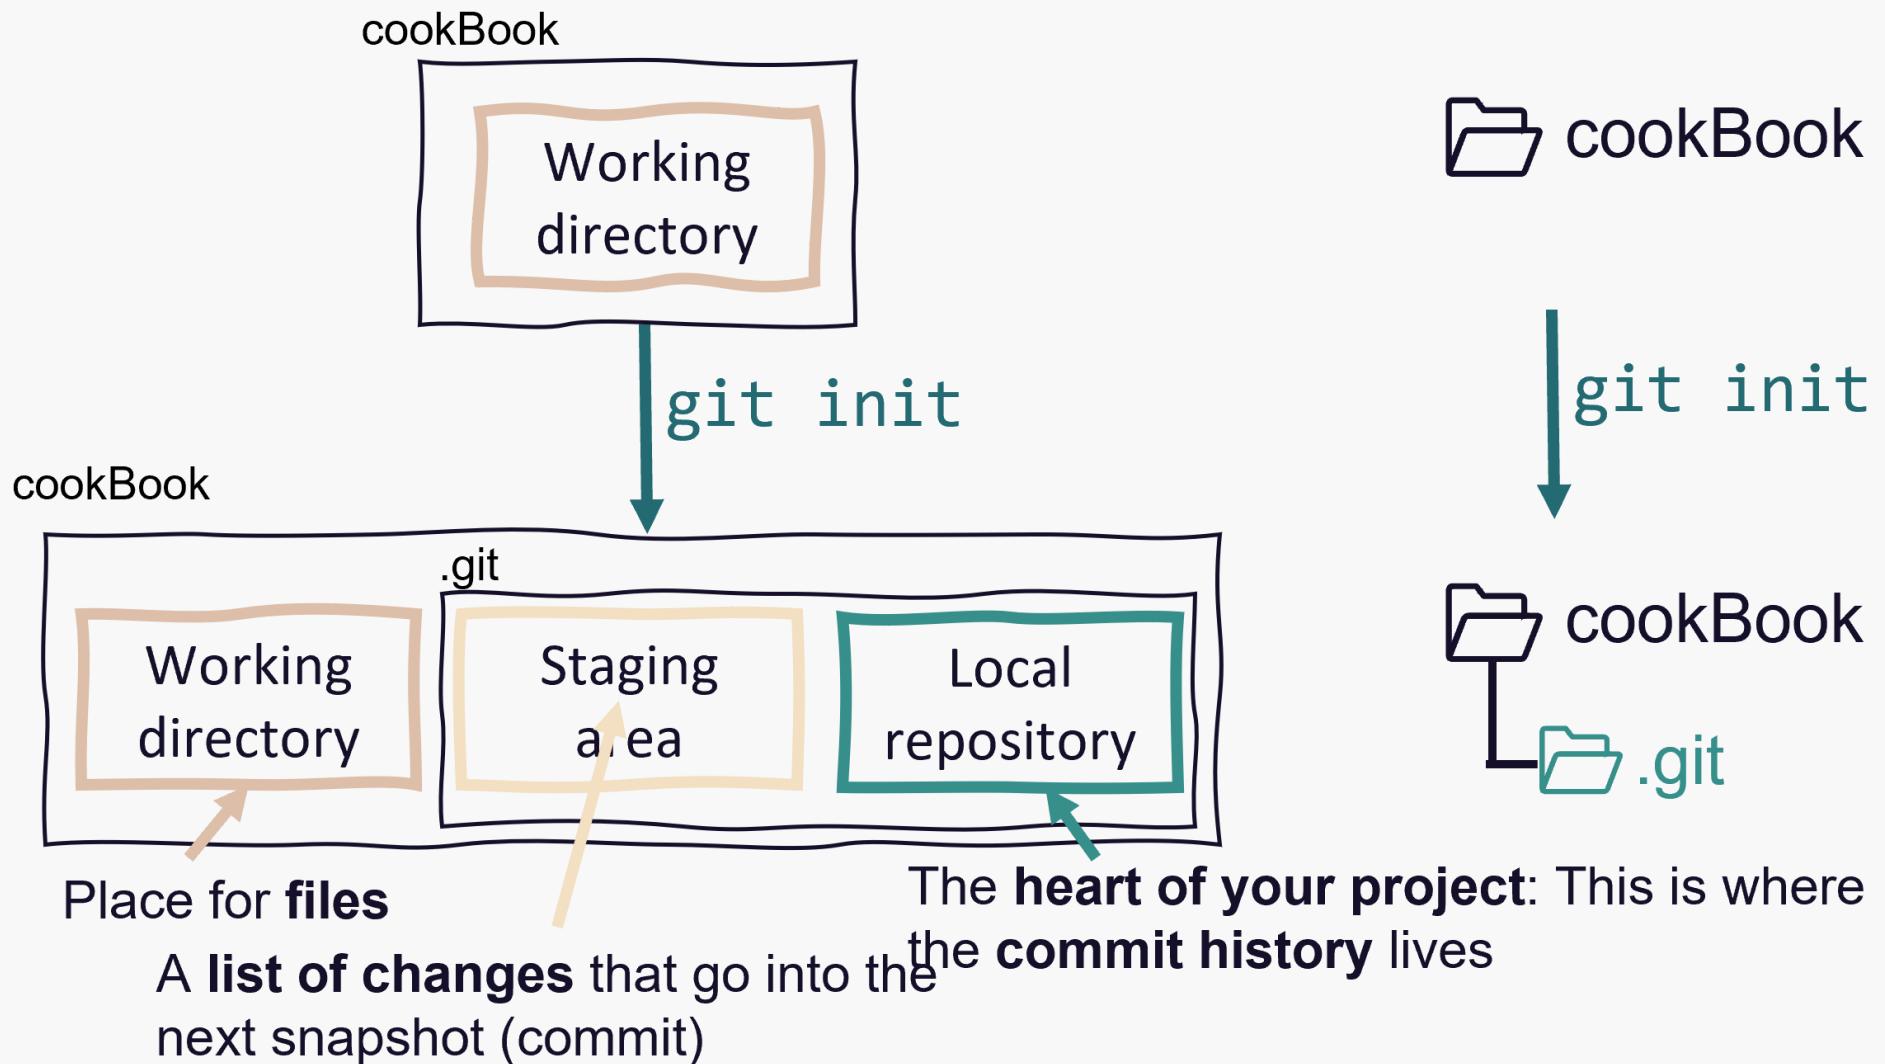

Step 1: Initialize a Git repository

Step 1: Initialize a Git repository

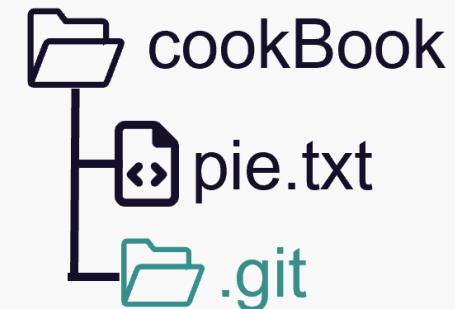

Step 1: Initialize a Git repository

Step 2: Add and modify files

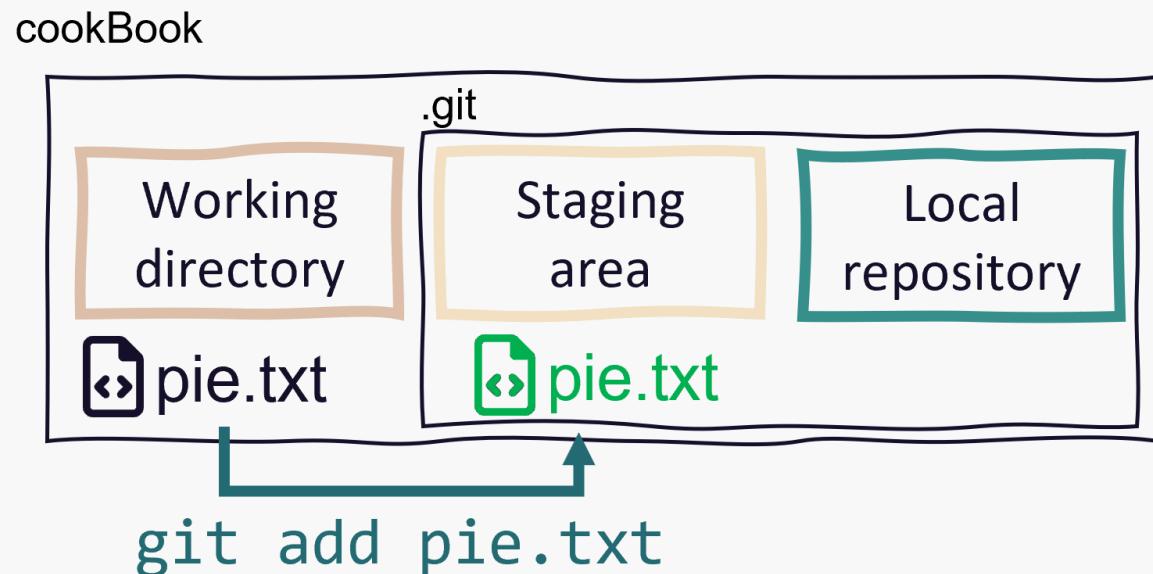

Git detects any changes in the working directory

cookBook

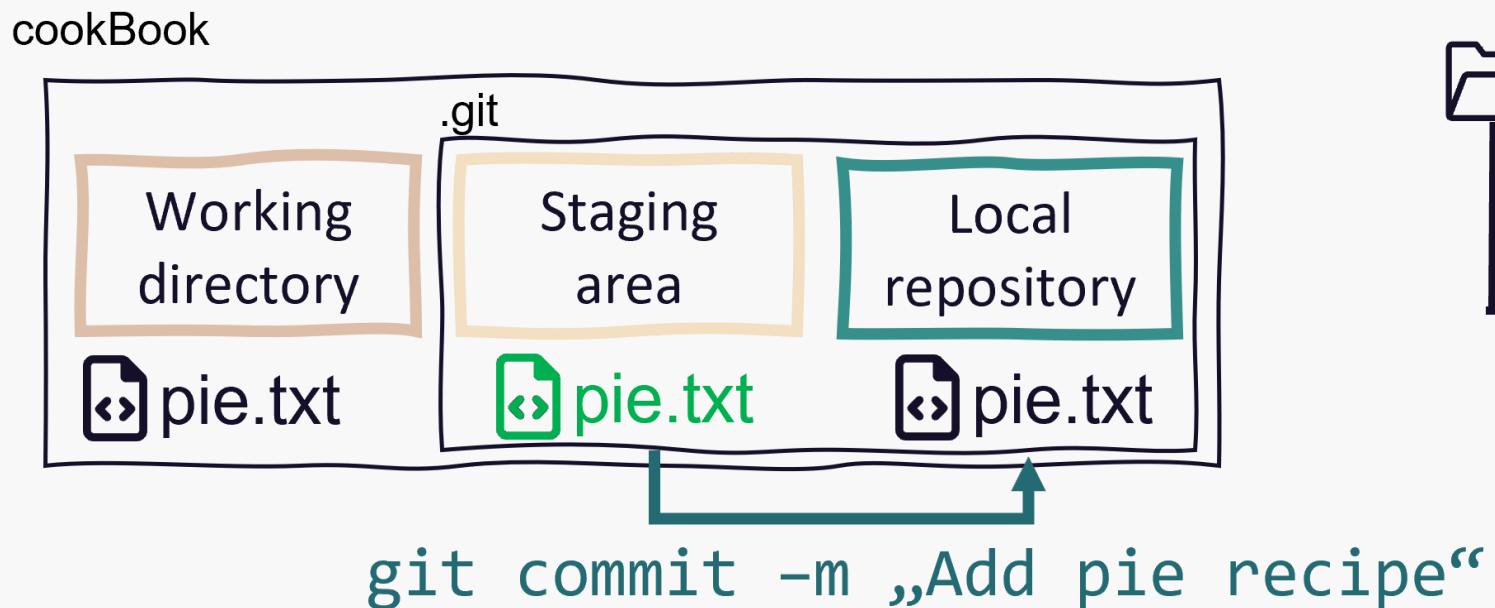

Step 2: Stage changes

Staging a file means to list it for the next commit.

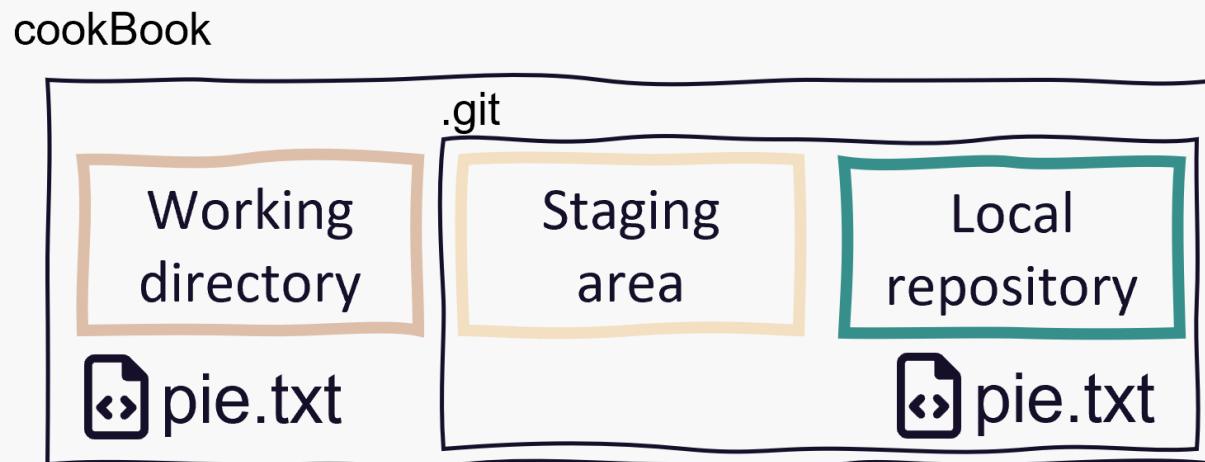

Step 3: Commit changes

- Commits are the snapshots of your project state

Step 3: Commit changes

- Changes are part of Git history and staging area is clear again

How to write good commit messages?

	COMMENT	DATE
O	CREATED MAIN LOOP & TIMING CONTROL	14 HOURS AGO
O	ENABLED CONFIG FILE PARSING	9 HOURS AGO
O	MISC BUGFIXES	5 HOURS AGO
O	CODE ADDITIONS/EDITS	4 HOURS AGO
O	MORE CODE	4 HOURS AGO
O	HERE HAVE CODE	4 HOURS AGO
O	AAAAAAA	3 HOURS AGO
O	ADKFJSLKDFJSOKLFJ	3 HOURS AGO
O	MY HANDS ARE TYPING WORDS	2 HOURS AGO
O	HAAAAAAAAANDS	2 HOURS AGO

AS A PROJECT DRAGS ON, MY GIT COMMIT MESSAGES GET LESS AND LESS INFORMATIVE.

xkcd on commit messages

How to write good commit messages?

Add pie recipe

This is my favorite pie in the world.
The recipe comes from my grandfather and
he learned it from his neighbor.

added a file.

This is a a really good recipe that I li

See [here](#) for more details but some general rules:

1. Limit summary line to 50 characters
2. Capitalize summary line
3. Do not end summary line with period
4. Use imperative mood in the subject line
5. Use the *Description* to explain **what** and **why**, not **how**

Now you

Start your own cook book

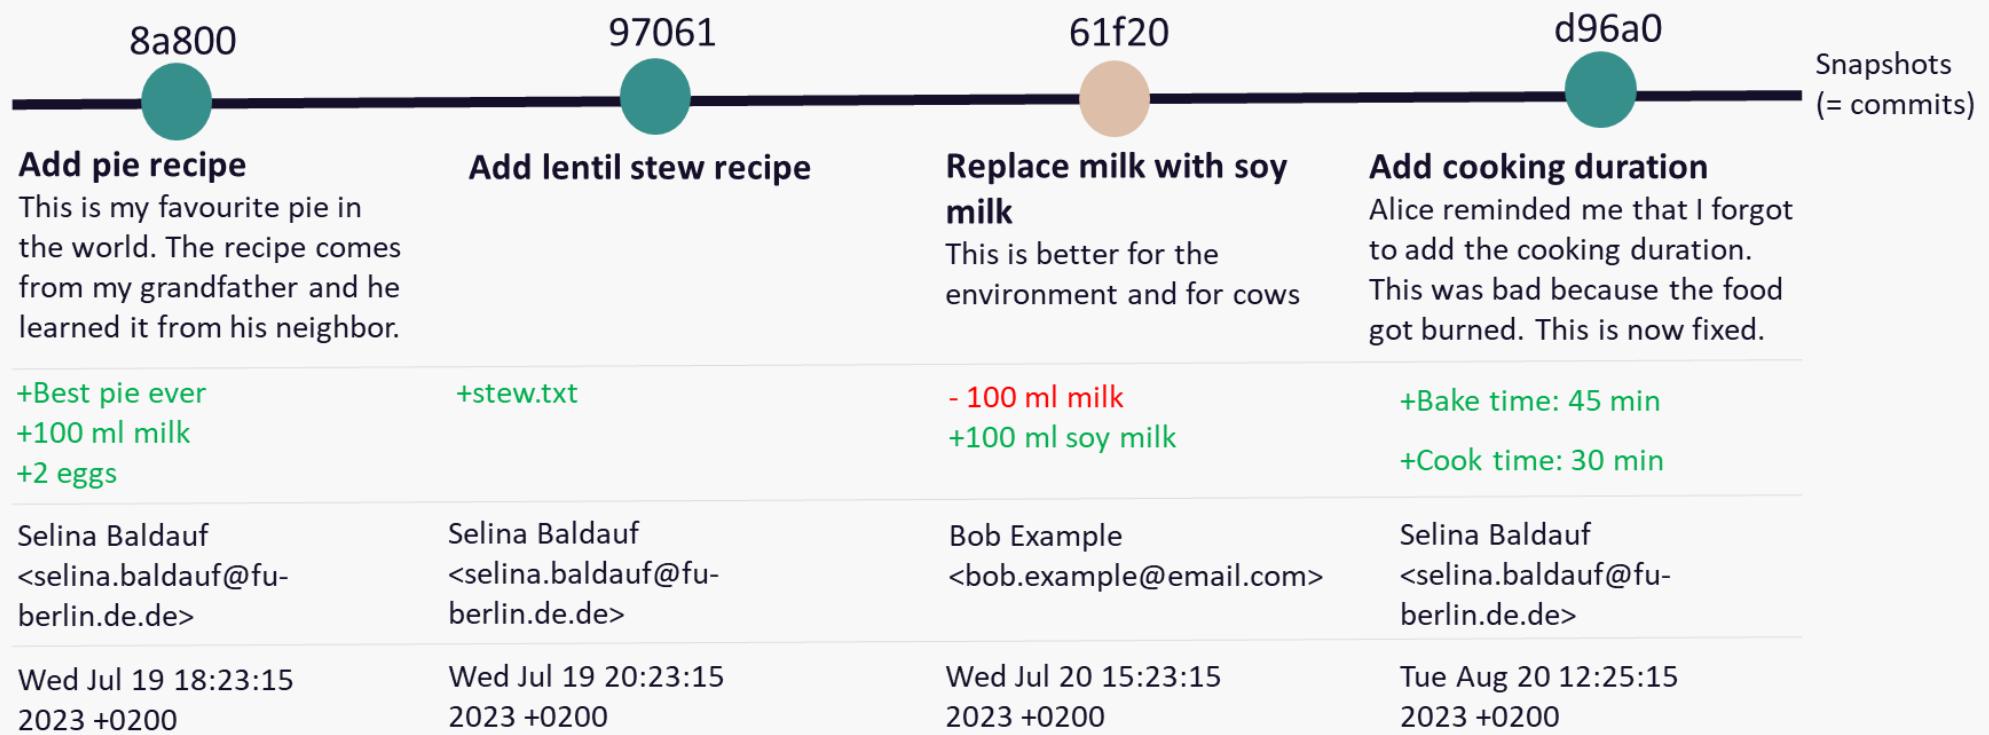

Complete task 1 “Local repo” (10 - 15 min)

Stay in the meeting for the task.

Ask if you are stuck.

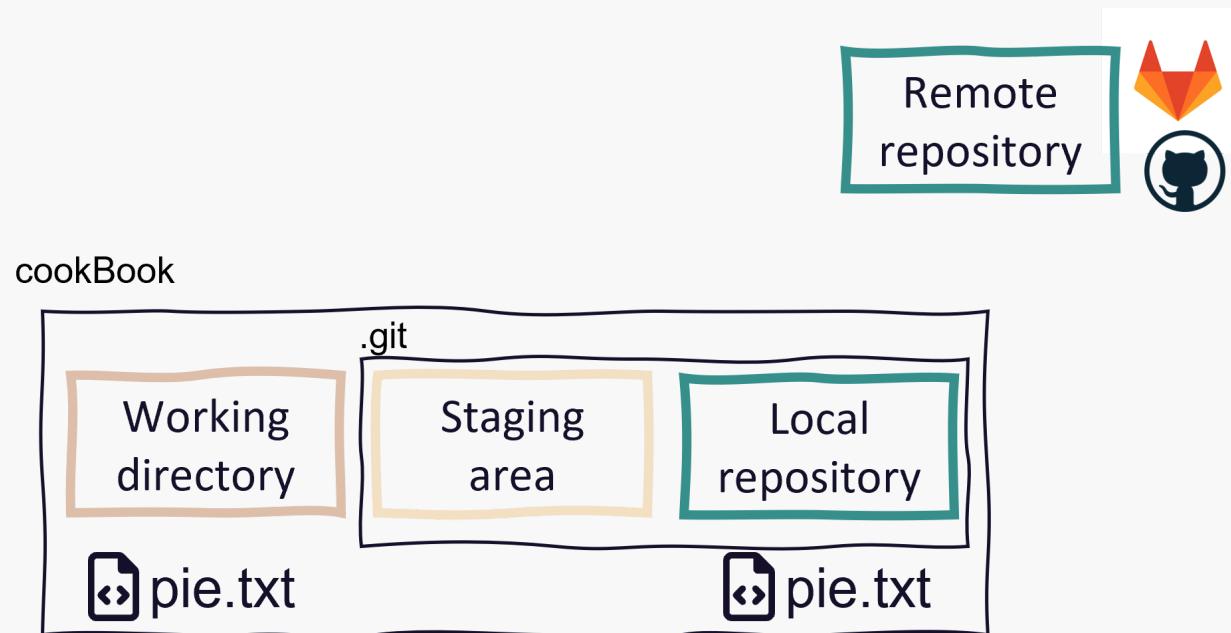

Turn down/off volume if you are disturbed.

The commit history

				Snapshots (= commits)
8a800	97061	61f20	d96a0	
Add pie recipe This is my favourite pie in the world. The recipe comes from my grandfather and he learned it from his neighbor.	Add lentil stew recipe	Replace milk with soy milk This is better for the environment and for cows	Add cooking duration Alice reminded me that I forgot to add the cooking duration. This was bad because the food got burned. This is now fixed.	
+Best pie ever +100 ml milk +2 eggs	+stew.txt	- 100 ml milk +100 ml soy milk	+Bake time: 45 min +Cook time: 30 min

Wed Jul 19 18:23:15 2023 +0200	Wed Jul 19 20:23:15 2023 +0200	Wed Jul 20 15:23:15 2023 +0200	Tue Aug 20 12:25:15 2023 +0200	

Step 4: Share changes with the remote repo

- Use remote repos (on a server) to *synchronize, share and collaborate*
- Remote repos can be *private* (you + collaborators) or *public* (visible to anyone)

Step 4: Share changes with the remote repo

Different remote repositories

- There are **commercial** and **self-hosted** options for your remote repositories
 - Commercial: Github, Gitlab, Bitbucket, ...
 - Self-hosted: Gitlab (maybe at your institution?)
- Please be aware of your institutional guidelines
 - Servers outside EU
 - Privacy rules might apply

Now you

Publish your cook book on Github

Checkout your repositories Github page (**Repository -> View on GitHub**) 5 min

Summary of the basic steps

- `git init`: Initialize a git repository
 - Adds a `.git` folder to your working directory
- `git add`: Add files to the staging area
 - This marks the files as being part of the next commit
- `git commit`: Take a snapshot of your current project version
 - Includes time stamp, commit message and information on the person who did the commit
- `git push`: Push new commits to the remote repository
 - Sync your local project version with the remote e.g. on Github

Undo things

git revert

Revert changes

- Use `git revert` to revert specific commits
- This does not delete the commit, it creates a new commit that undoes a previous commit
 - It's a safe way to undo committed changes

Now you

Revert a commit from your cook book

Publish your repositories

Publish your repositories

Github/Gitlab are a good way to publish and share your work.

Advantages of publishing your code

- Others can build on your work
- Citations
- Reproducibility
- Get feedback

Publish your repositories

You can increase the quality/complexity of your repo by

- Adding a nice README.md file
- Connecting the repo with Zenodo to get a DOI
- Create a Github pages website alongside your repo
- Encourage people to write issues if they find problems
- ...

Thanks for your attention

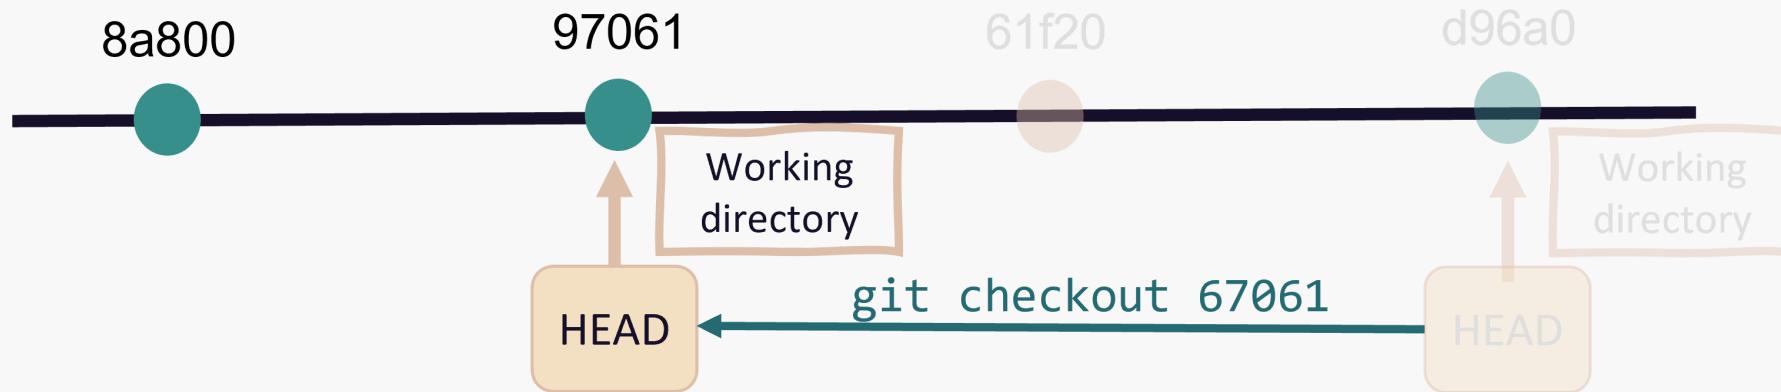

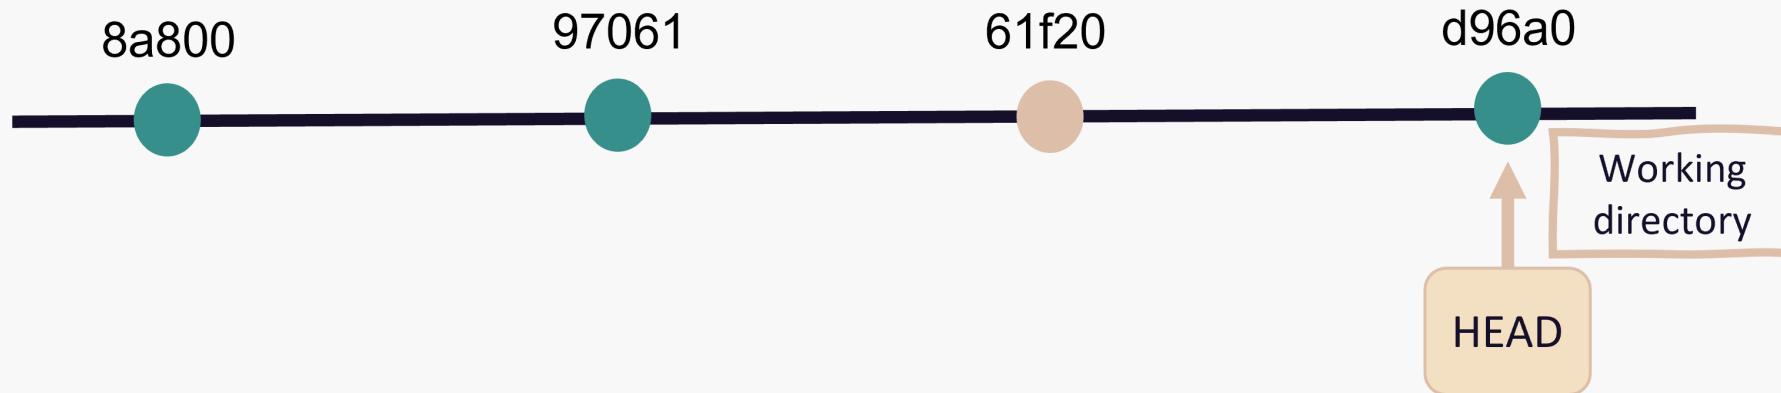

Questions?

Go back in time

```
| git checkout
```

Checkout a previous commit

- Bring your work space back in time temporarily with `git checkout`

Ignoring files

Ignore files with `.gitignore`

- Create a file with the name `.gitignore` in working directory
- Add all files and directories you want to ignore to the `.gitignore` file
- Useful to ignore e.g.
 - Compiled code and build directories
 - Log files
 - Hidden system files
 - Personal IDE config files
 - ...

Ignore files with `.gitignore`

- Create a file with the name `.gitignore` in working directory
- Add all files and directories you want to ignore to the `.gitignore` file

Example

```
*.html      # ignore all .html files  
*.pdf       # ignore all .pdf files  
  
debug.log   # ignore the file debug.log  
  
build/      # ignore all files in subdirectory build
```

See [here](#) for more ignore patterns that you can use.

Preparation for tomorrow

- Tomorrow we have teams of 2
- Collaborate on the cook book of your team mate

Now please

1. Enter your Github Account Name and the link to your repo [here](#)
 2. Look for the Github Name of your team mate and add them as a collaborator to your repository
 3. Accept the invitation of your team mate to their repository
- You will get an Email or you can do it on Github
